Context: Evolving ecosystem

Shrink wrapped ⇒ Software-as-a-Service
Monolithic ⇒ Services
On-premise ⇒ Cloud

Shrink wrapped (SWS) ⇒ Software-as-a-Service (SaaS)

**SWS**
Client-specific binaries that must work in many HW/SW environments
+ Rich user experience
- Hard to maintain, with extensive compatibility testing required

**SaaS**
Online client-server model
+ One copy of SW, one HW environment (controlled by developers)
+ Easy to release updates
+ Easier to enable user collaboration
- Limited by online latency, capabilities of browser

*What about mobile native applications?*
Which of the following is a disadvantage of services-oriented-architecture (SOA) compared to a monolithic design? SOA:

A. May be harder to debug & tune
B. Results in lower developer productivity
C. Complexity is a poor match for small teams
D. Is more expensive to deploy than a monolithic design, because more hardware is needed to handle the same workload

Bezos’ 2002 services mandate
1. All teams will henceforth expose their data and functionality through service interfaces.
2. Teams must communicate with each other through these interfaces.
3. There will be no other form of interprocess communication allowed: no direct linking, no direct reads of another team’s data store, no shared-memory model, no back-doors whatsoever. The only communication allowed is via service interface calls over the network.
4. It doesn’t matter what technology they use. HTTP, Corba, Pubsub, custom protocols -- doesn’t matter. Bezos doesn’t care.
5. All service interfaces, without exception, must be designed from the ground up to be externalizable. That is to say, the team must plan and design to be able to expose the interface to developers in the outside world. No exceptions.
6. Anyone who doesn’t do this will be fired.

Steve Yegge blog post (2011)

SaaS 3 demands on infrastructure

1. Communication: Customers must be able to interact with service
2. Scalability: Respond to fluctuations in demand or new services adding users rapidly
3. Dependability: Service & communication available 24x7

Cloud providers can offer all three on a pay-as-you-go basis (utility) at hard to match prices

Single Page Applications (SPA)

Server now mostly provides data, making SPAs natural consumers of (micro)services

Wasson, Microsoft
Plan & Document ⇒ Agile

“Plan-and-Document”:
1. Before coding, the project manager makes plan
2. Write detailed documentation for all phases of the plan
3. Progress measured against the plan
4. Changes to project must be reflected in changes to documentation and the plan

Implementations: Waterfall, Spiral, ...

Agile Manifesto (2001)

We are uncovering better ways of developing software by doing it and helping others do it. Through this work we have come to value:

- **Individuals and interactions** over processes and tools
- **Working software** over comprehensive documentation
- **Customer collaboration** over contract negotiation
- **Responding to change** over following a plan

That is, while there is value in the items on the right, we value the items on the left more.

http://agilemanifesto.org
“Full-Stack”, “DevOps” and other buzzwords...

“A Full-Stack Web Developer is someone who is able to work on both the front-end and back-end portions of an application.”[1]

DevOps? Cross-functional (no more silos) teams that:
• Apply “development” practices to operations, e.g. infrastructure as code
• Automate everything
• Integrate operations into developer role

Which aspect of the software lifecycle consumes the most resources?
A. Design  
B. Development  
C. Testing/debugging  
D. Maintenance

Summarizing our (the) landscape

• SW (can) evolve quickly to match user needs
• But doing so requires a development process that embraces change
• Agile is a process that embraces change (as opposed to plan & document, etc.)
• SaaS is an ideal domain for Agile processes
• Cloud gives everyone access to scalable HW and services for implementing SaaS
• SPAs are natural consumers of these (micro)services

Beautiful code

Beautiful code:
• Meets customer needs
• Easy to evolve

The “cruft” that makes enhancements expensive is the technical debt created by doing the easy thing, not the “Right Thing”
What I ask of you

“Do the class”

• Commit to the CS312 tools and processes
  
Perfect practice makes perfect

• Be a good teammate
  
Be responsible for your learning, don’t get left behind

Use your knowledge to make your team better

Being a great teammate

Li et al. study “What Makes a Great Software Engineer”

<table>
<thead>
<tr>
<th>Attribute and description</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creates shared context</td>
<td>—molding another person’s understanding of the situation while tailoring the message to be relevant and comprehensible to the other person.</td>
</tr>
<tr>
<td>Creates shared success</td>
<td>—enables success for everyone involved, possibly involving personal compromises.</td>
</tr>
<tr>
<td>Creates a safe haven</td>
<td>—creating a safe setting where engineers can learn and improve from mistakes and situations without negative consequences.</td>
</tr>
