Base-10 to Base-2?

Algorithm for converting number N to base-2

step 1: if N is 0, go to step 5

step 2: divide N by 2 to get a quotient and remainder

step 3: set N to be the quotient

step 4: return to step 1

step 5: read off the remainders in reverse order - this is the number in base-2

$$N = 19_{10}$$

$$N / 2 = 9 \text{ R } 1, N = 9$$

$$N / 2 = 4 \text{ R } 1, N = 4$$

$$N / 2 = 2 \text{ R } 0, N = 2$$

$$N / 2 = 1 \text{ R } 0, N = 1$$

$$N / 2 = 0 \text{ R } 1, N = 0$$

$$19_{10} = 10011_2$$

Doing math...

$$\begin{array}{r} 1 \\ 1 \\ + 1 \\ \hline 10 \end{array}$$

$$\begin{array}{r} 1\ 1\ 1\ 1 \\ 1101 \\ + 0011 \\ \hline 10000 \end{array} \quad \begin{array}{l} 13 \\ 3 \\ 16 \end{array}$$

$$\begin{array}{r} 10 \\ \times 11 \\ \hline 10 \\ + 10 \\ \hline 110 \end{array} \quad \begin{array}{l} 2 \\ 3 \\ 6 \end{array}$$

Integer Representation on a computer

- **Need to represent positive and negative numbers**

→ Use a sign bit

- **Two's complement notation**

- Represent an integer with fixed # of bits

- Leftmost bit is the *sign bit* (0: positive, 1: negative)

- "Binary odometer": 1: 0001

 0: 0000

 -1: 1111

Two's complement with 4 bits

Decimal	Bit Pattern
7	0111
6	0110
5	0101
4	0100
3	0011
2	0010
1	0001
0	0000
-1	1111
-2	1110
-3	1101
-4	1100
-5	1011
-6	1010
-7	1001
-8	1000

Two's complement

- To change sign:
 - From *right to left*, copy any 0s and first 1
 - Invert the remaining bits
- Examples (using 8 bits):

-20:	1110	1100	+96:	0110	0000	-1:	1111	1111	0:	0000	0000
+20:	0001	0100	-96:	1010	0000	+1:	0000	0001	0:	0000	0000
